

Publish an ASP.NET Core Application to a Windows Server Virtual Machine

Summary:-

In this lab, an ASP.NET Core Razor Pages application is created using Visual Studio Code, published with the .NET CLI, and deployed to a Windows Server 2025 virtual machine running IIS. The published application replaces the default IIS webpage and is verified through the virtual machine's public IP address.

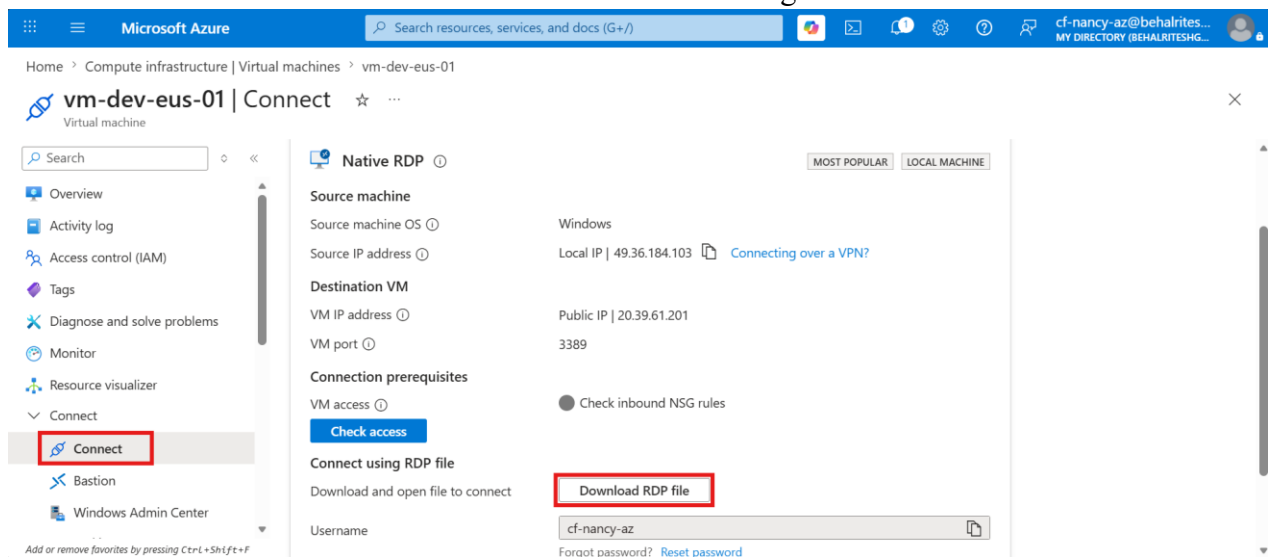

Let's Start:-

- Install the .NET Hosting Bundle.
- Create an ASP.NET Core web application.
- Publish the application.
- Copy the published files to IIS.
- Verify the deployed application.

Lab Steps

Step 1 – Install the .NET Hosting Bundle

- Connect to the Windows Server virtual machine using RDP.

- Open Microsoft Edge.
- Download the latest **ASP.NET Core Hosting Bundle**.

10.0.9 Security patch

[Release notes](#) Latest release date June 9, 2026

Build apps - SDK

SDK 10.0.301

OS	Installers	Binaries
Linux	Package manager instructions	x64 Arm64 Arm32 x64 Alpine Arm64 Alpine Arm32 Alpine
macOS	x64 Arm64	x64 Arm64
Windows	x64 x86 Arm64 winget instructions	x64 x86 Arm64
All	dotnet-install scripts	

Included in
Visual Studio 18.7.0

Included runtimes
.NET Runtime 10.0.9
ASP.NET Core Runtime 10.0.9
.NET Desktop Runtime 10.0.9

Run apps - Runtime

ASP.NET Core Runtime 10.0.9

The ASP.NET Core Runtime enables you to run existing web/server applications. **On Windows, we recommend installing the Hosting Bundle, which includes the .NET Runtime and IIS support.**

IIS runtime support (ASP.NET Core Module v2)
20.0.26140.9

OS	Installers	Binaries

Home / Download / .NET / 10.0

Welcome to the Microsoft .NET 10.0.9 - Windows

Please restart IIS after the installation completes. You can find additional information [here](#).

By clicking Install, you agree to the following terms:

- [Privacy Statement](#)
- [Telemetry collection and opt-out](#)
- [Licensing information for .NET](#)

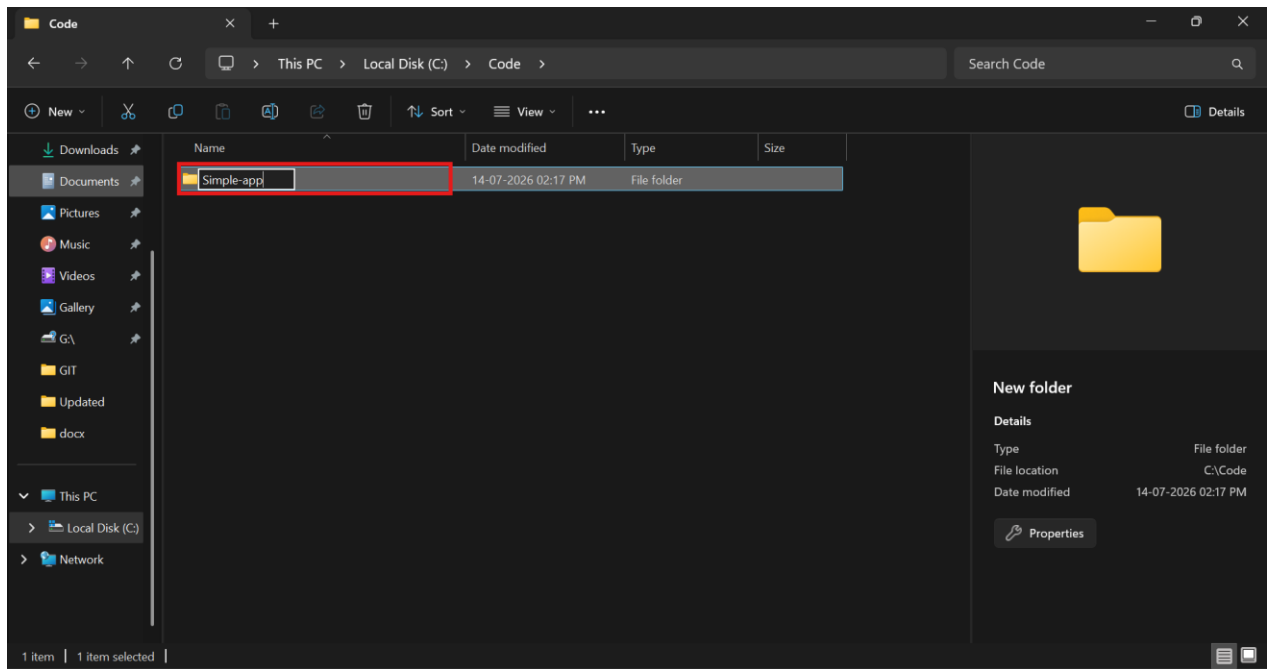

Install Close

ASP.NET Core Hosting Bundle contains everything you need to run existing web/server apps. The bundle includes the .NET runtime, the ASP.NET Core runtime, and if installed on a machine with IIS it will also add the [ASP.NET Core IIS Module](#). If you only want the .NET or ASP.NET Core runtime, you'll find them in [.NET 10.0 Downloads](#).

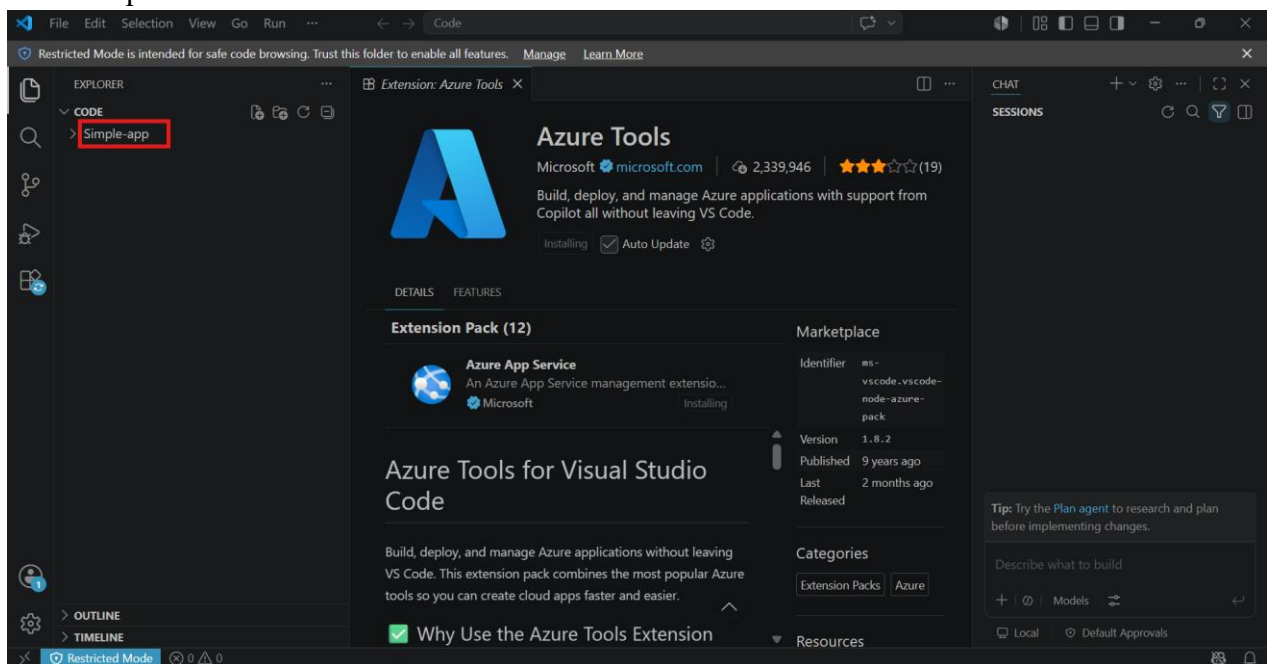

- Complete the installation.

Step 2 – Create an ASP.NET Core Web Application

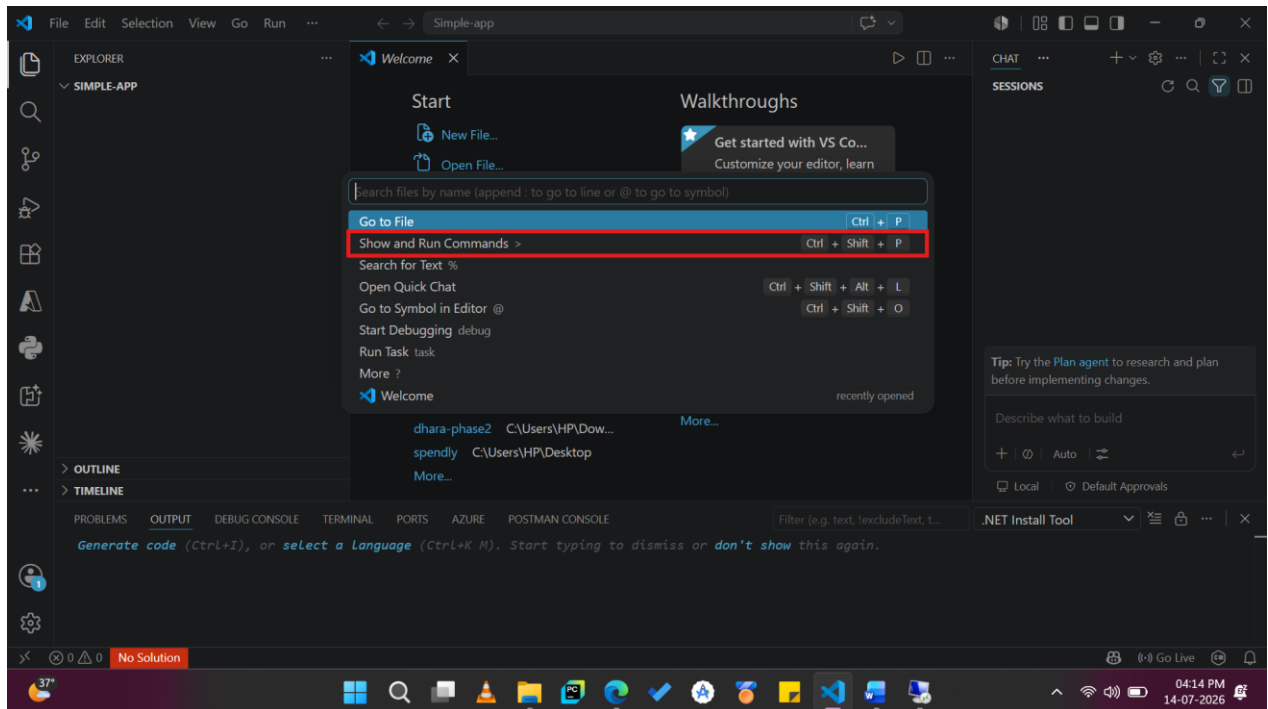

- Open Visual Studio Code in your PC (system).
- Create a new folder for the project.

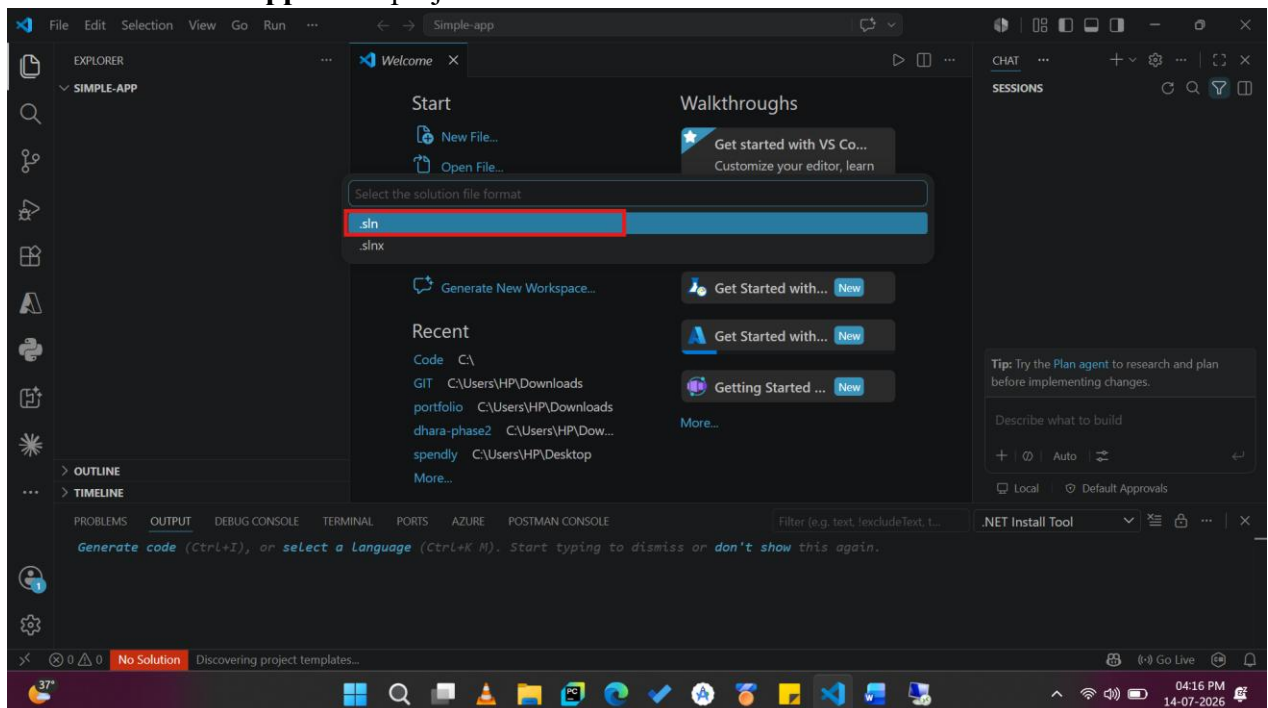

- Open the folder.

- Ensure that the **C# Dev Kit (or C# extension)** and **Azure Tools** extensions are installed.
- Press **Ctrl + Shift + P** (or **F1**) to open the **Command Palette**. Select **Show And Run Commands >**.

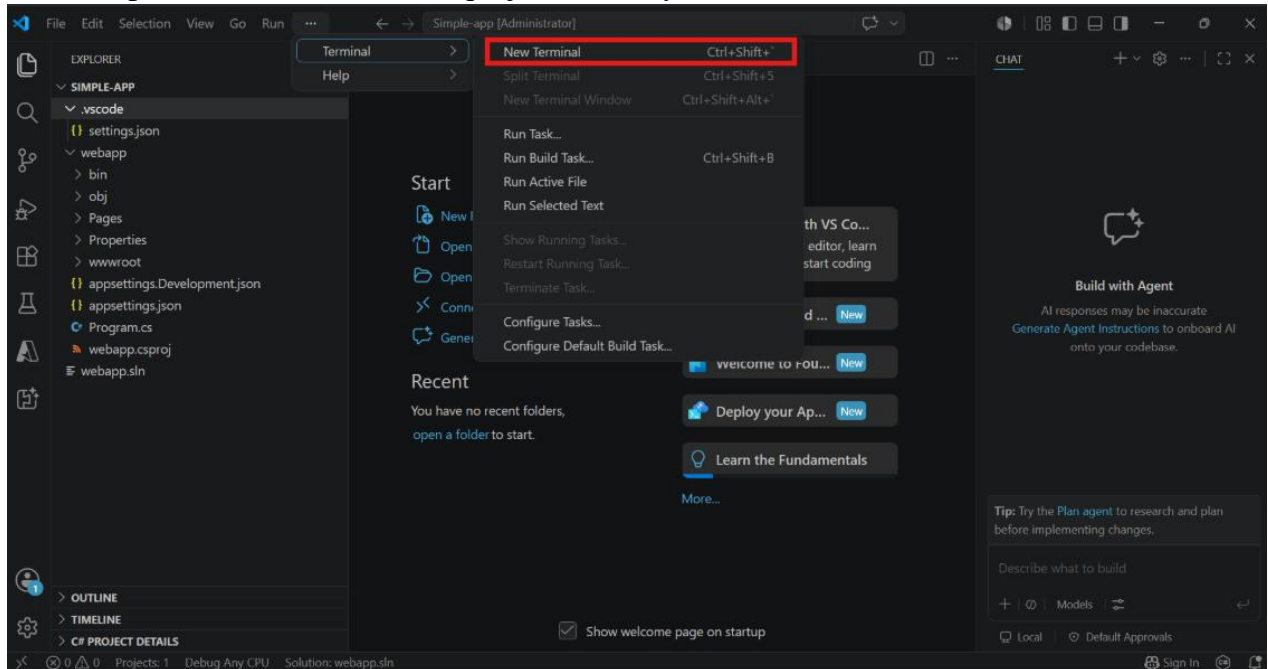

- Go to **.NET: New Project > ASP.NET Core Web App (Razor Pages)**. Choose the **SimpleApp** folder.
- Enter **WebApp** as the project name. Select **.sln**.

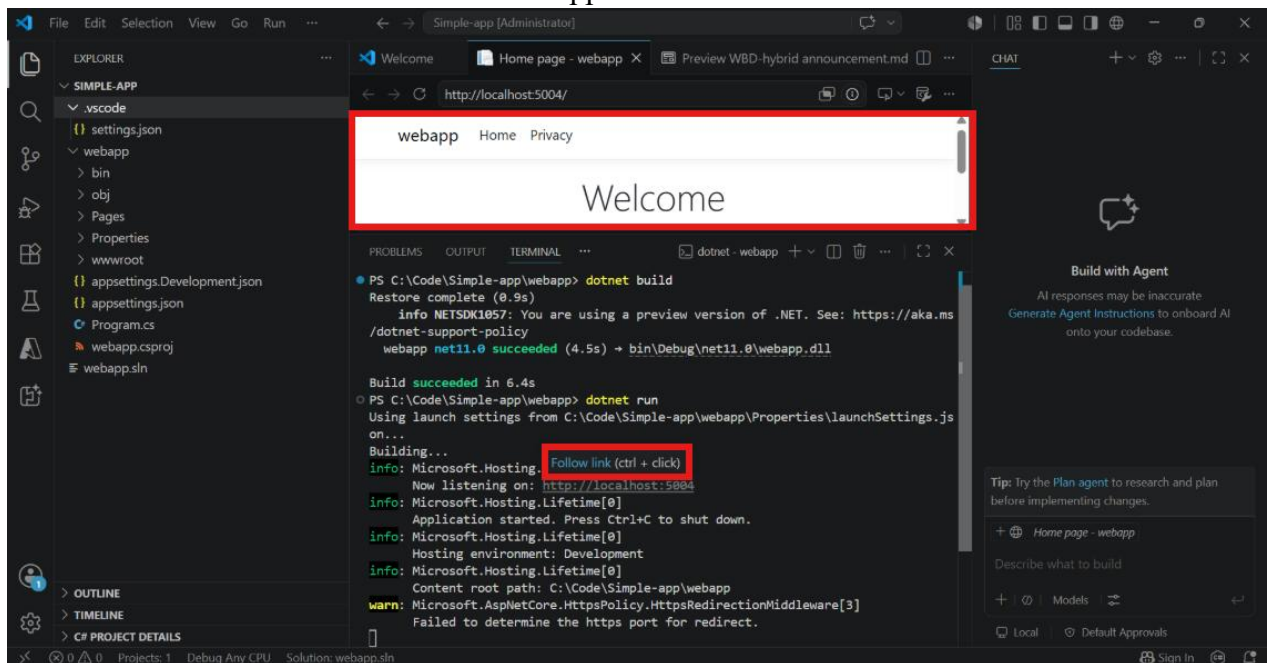

- Select **Create Project**.
- Build the application to verify that it compiles successfully.

Step 3 – Publish the Application

- Open a terminal inside the project directory

- Run:
cd webapp
dotnet build
dotnet run
- Choose Ctrl + Click to run the webapp.

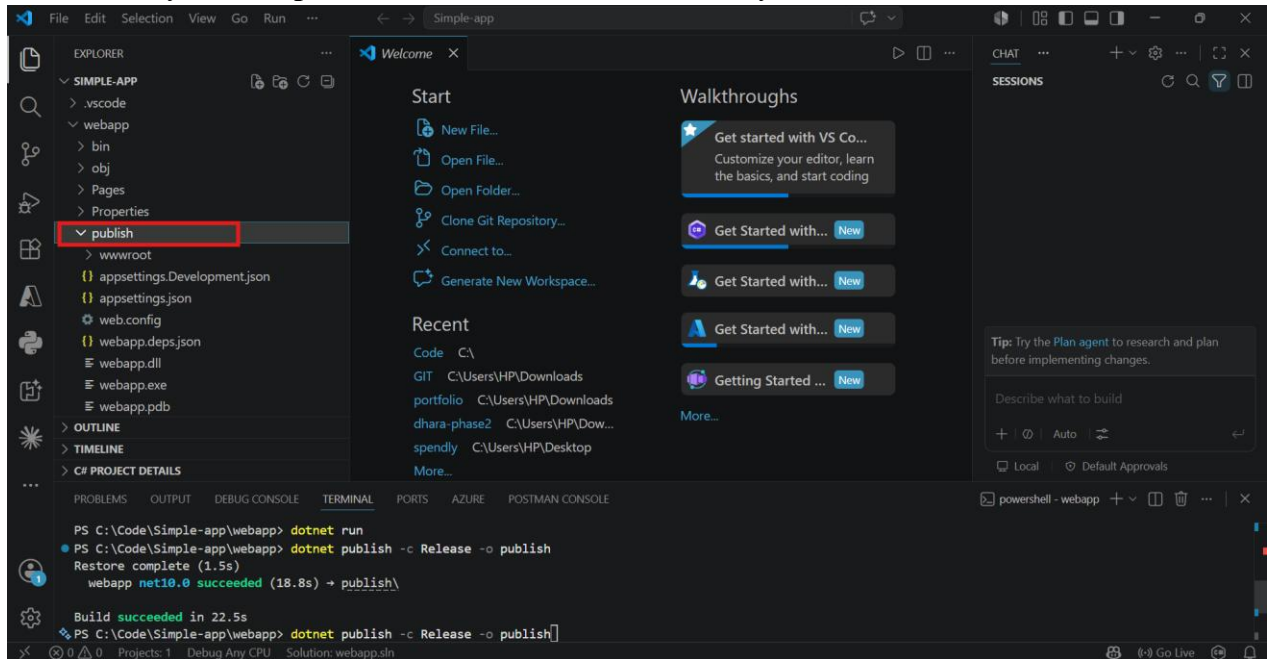

- Run:

Ctrl + C

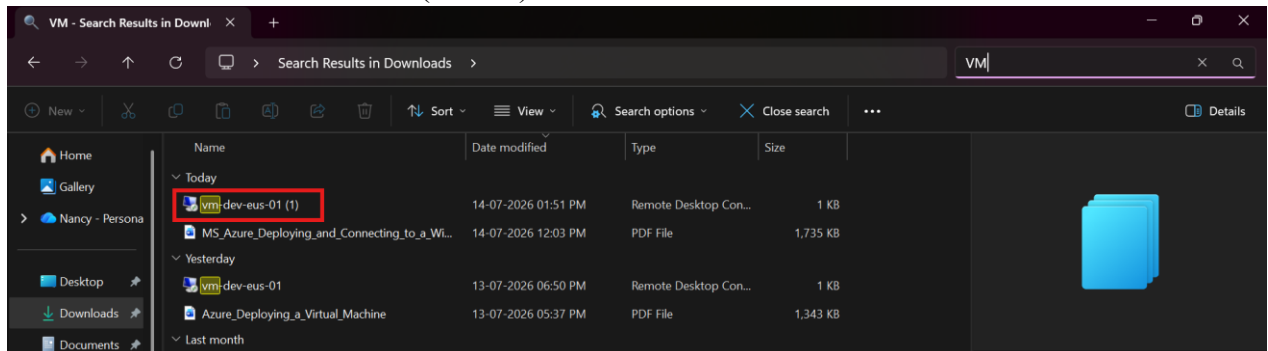

dotnet publish -c Release -o publish

- Verify that the **publish** folder is created successfully.

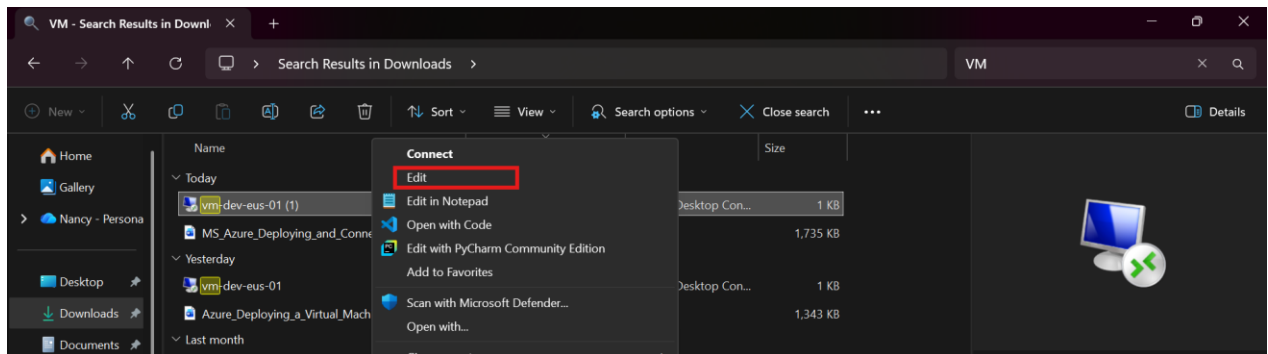

Step 4 – Copy the Published Files to the Virtual Machine

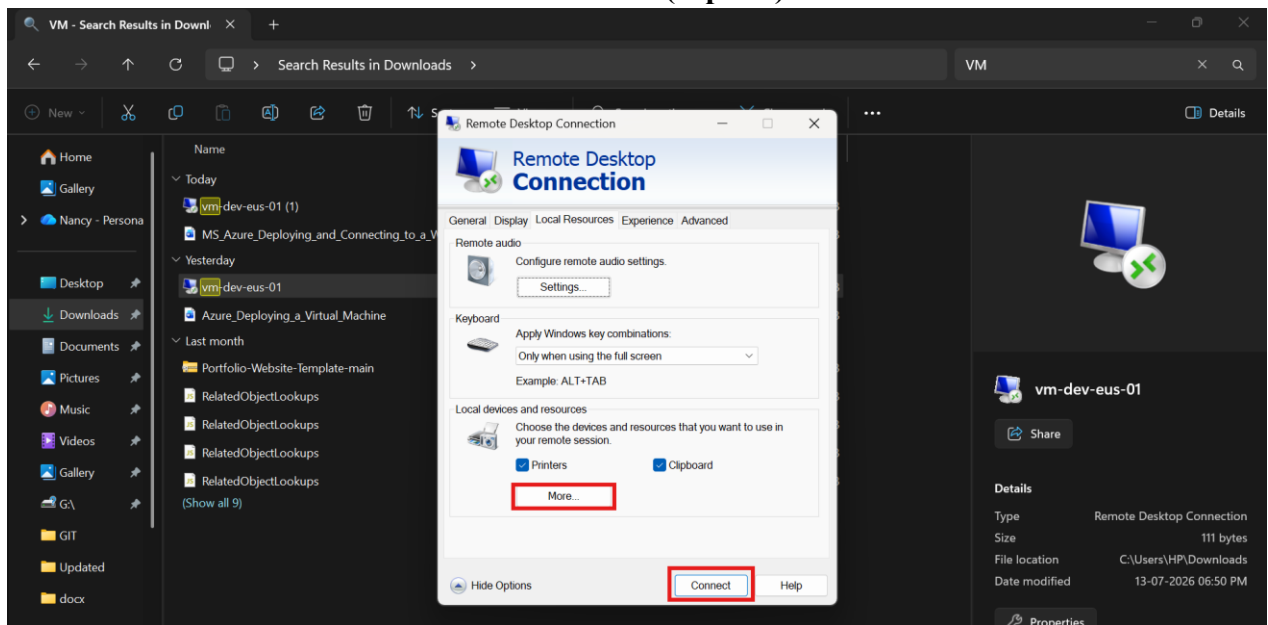

- It will show “Your Remote session will be disconnected”. Close the RDP session by clicking OK
- Now go to Downloads in your PC.
- Select “vm-dev-eus-01” (default).

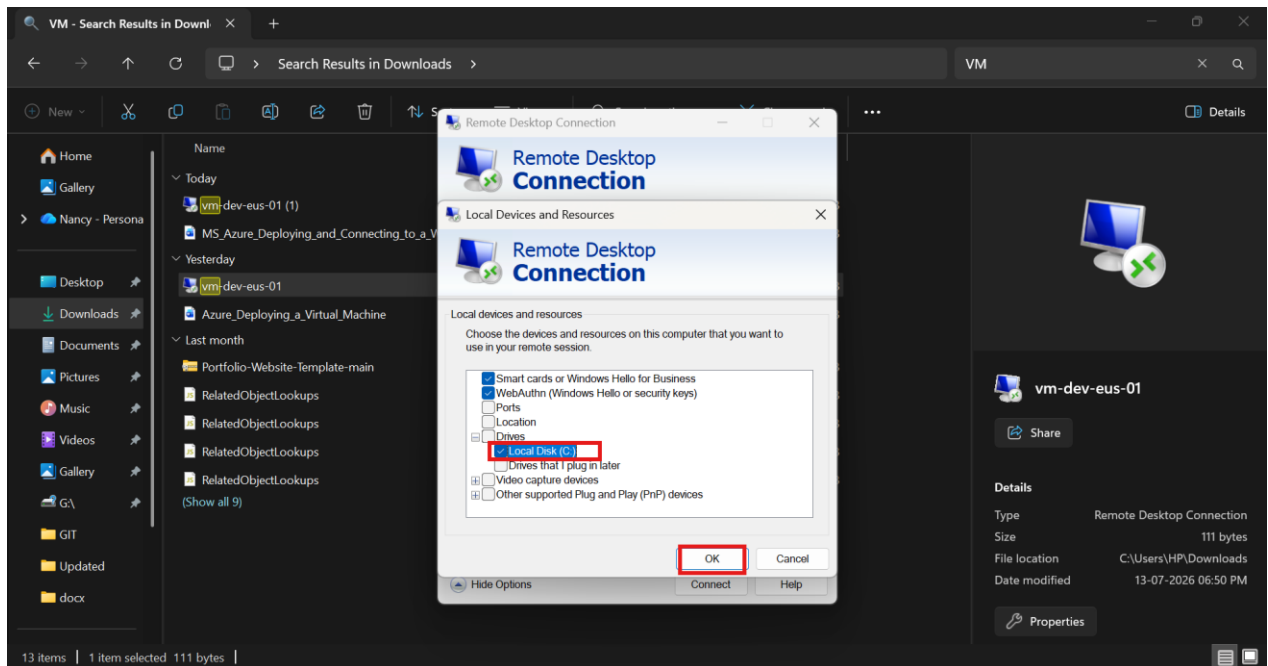

- Now right click and select more options.
- Click **Edit**.

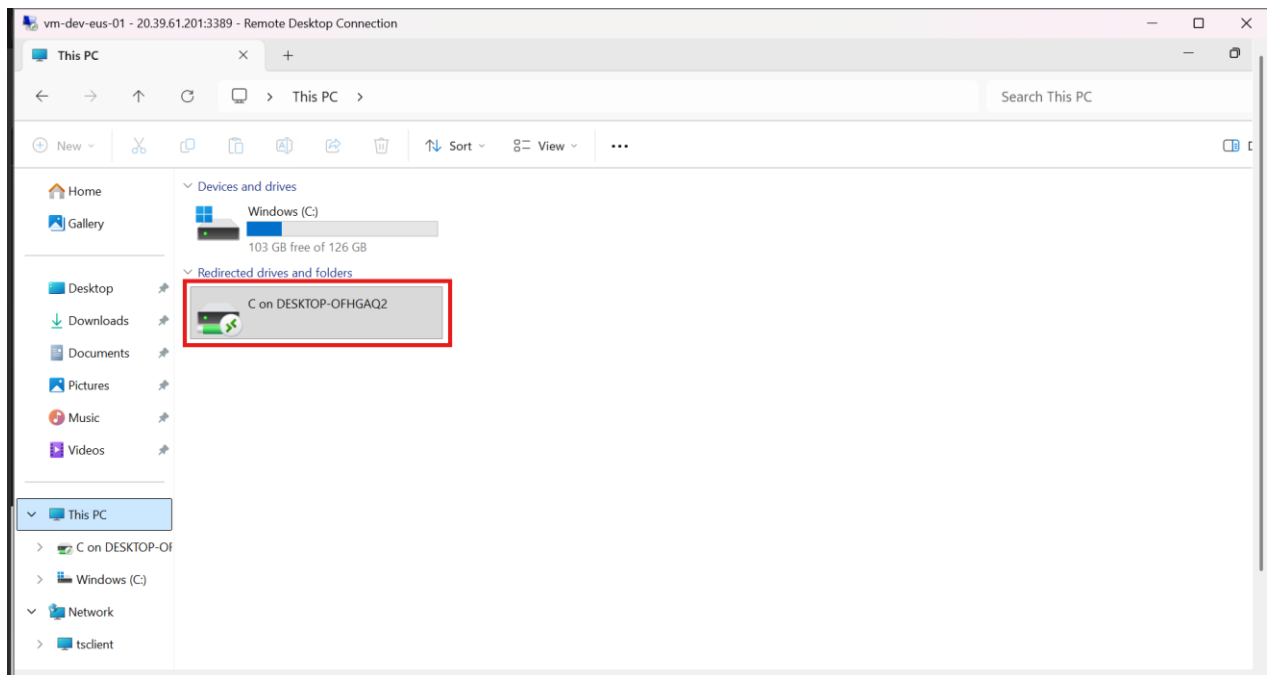

- Edit the RDP connection settings.
- Go to **Local Resources** → **More** → **Drives(expand)**.

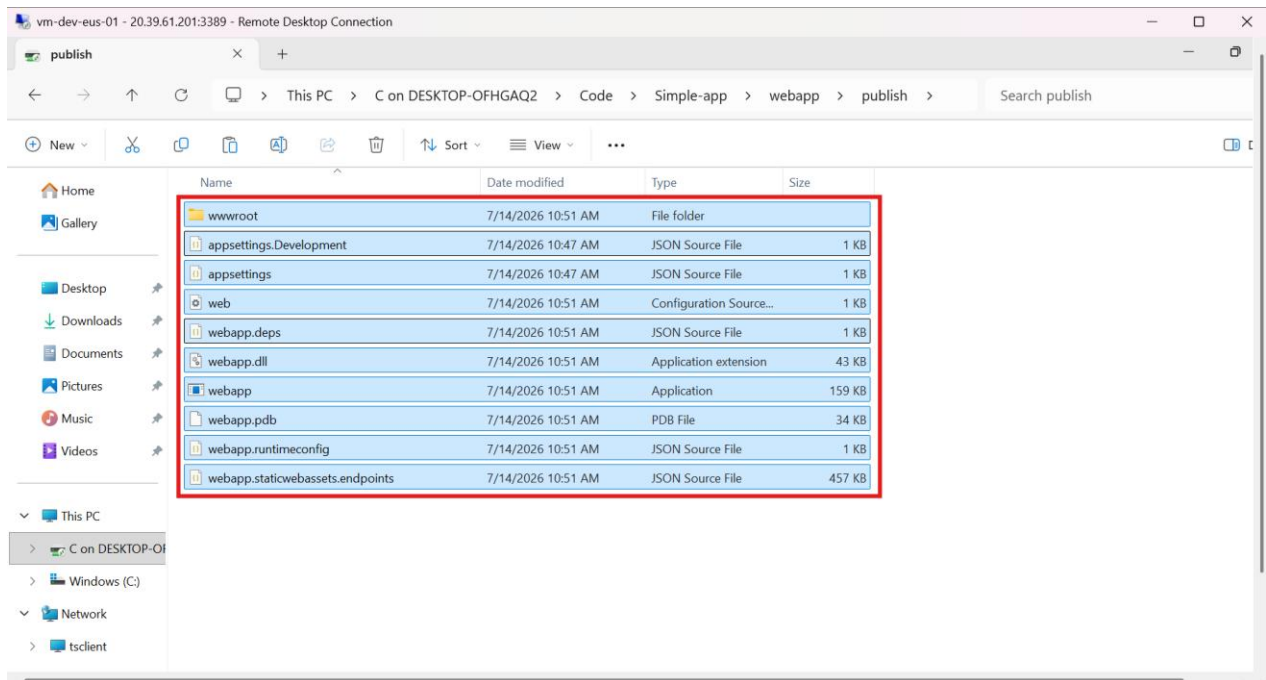

- Enable more → **Local disk**.

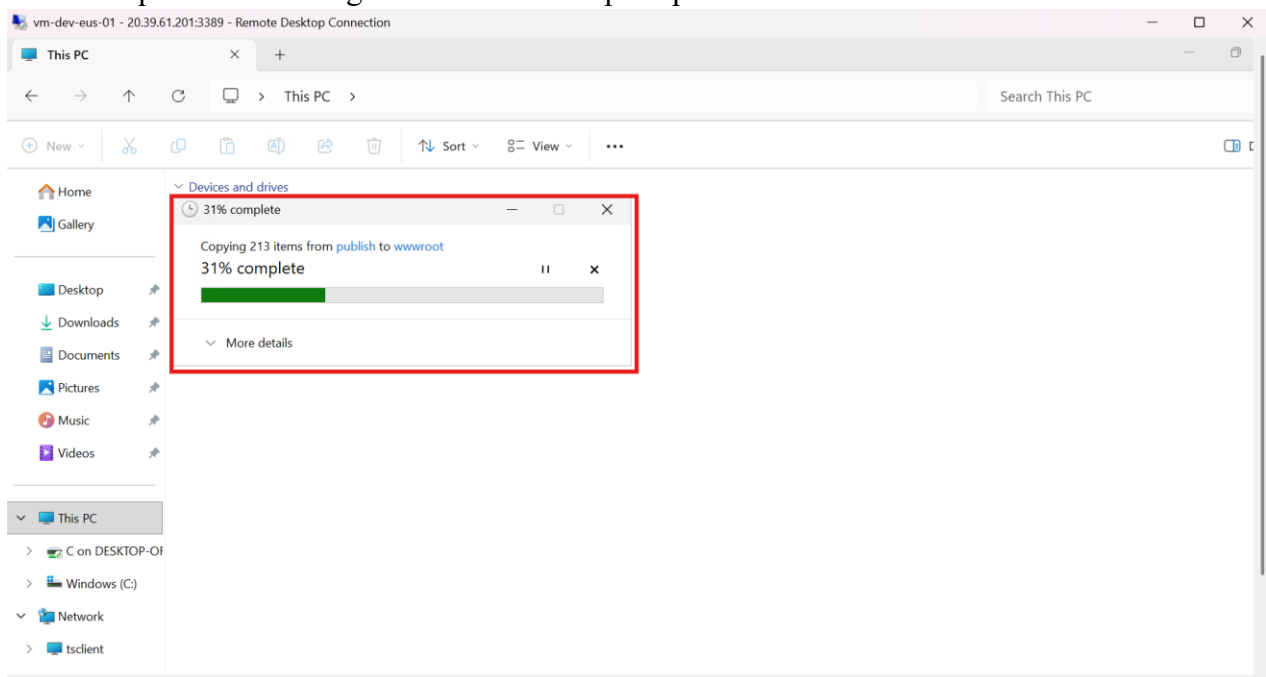

- Click Connect. Check Drive.
- Reconnect to the virtual machine.
- Open **This PC**.
- Access the shared local drive.

- Go to Code → webapp → Simple-app → publish.
- Copy all files from the **publish** folder.

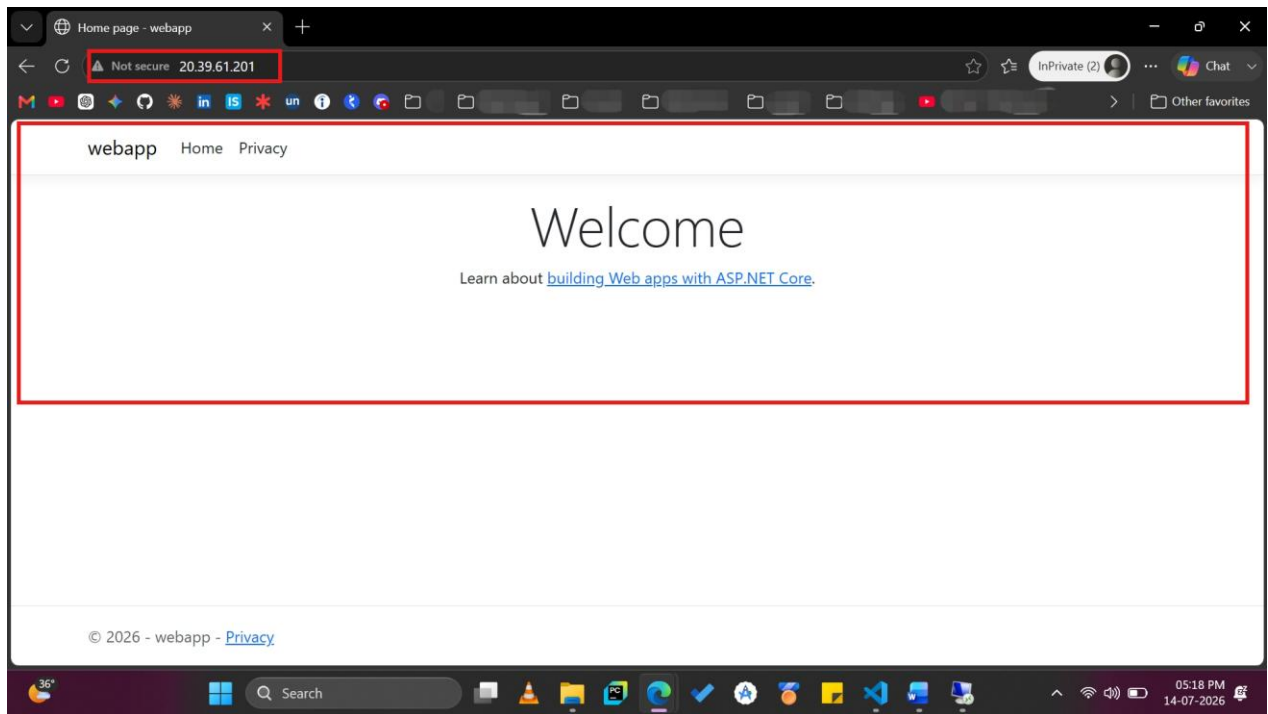

- Paste them into:
C:\inetpub\wwwroot
- Replace the existing IIS default files if prompted.

Step 5 – Verify the Application

- Open a web browser.
- Browse to:
<http://<Public-IP>>

- Verify that the ASP.NET Core application homepage is displayed instead of the default IIS webpage.

Verification

Verify that:

- The .NET Hosting Bundle is installed.
- The application is successfully published.
- The published files are copied to **C:\inetpub\wwwroot**.
- The ASP.NET Core application loads successfully using the virtual machine's public IP address.
